1. About Drossellog

Drossellog is a simple logfile analyzer in ruby. It was created because we were unhappy with the interfaces and functionality of other, already existing opensource logfile analyzers. We didn't want to extend the existing ones because we didn't liked their architecture either.

Drossellog is part of the XhochY projects.

XhochY ([More...](#))

2. Dependencies

- [Ruby](#): the ruby interpreter
- [Rake](#): a build system written in ruby, used for testing, documentation generation and some utility functions are used in the main scripts.
- [Rails](#): the most famous ruby internet framework, we use it to display the statistics.
